In developed economies like the U.S., Canada, and Europe, financial systems generally seem to function well. People enjoy the convenience of banks, reliable payment networks, and government-backed insurance on deposits. However, this perceived stability is largely built on public trust, which has been steadily eroding.

In the evolving world of cybersecurity, one of the most insidious threats today is cryptojacking. Different from traditional scams that target your personal information or financial assets, cryptojacking operates under the shadows. They hijack your device's computing power to mine cryptocurrency without your consent.

A Decentralized Exchange is a platform where users may trade cryptocurrencies without the use of an intermediary. They do not use an intermediary entity to settle transactions, instead of relying on self-executing smart contracts to facilitate trade. With no intermediary, most DEXs have little counterparty risk.
